The Zapotitlan Salinas Valley is located in the southeast area of Puebla, Mexico (18° 20'N, 97° 28'W, 1540 m a.s.l.) and is part of the Tehuacan-Cuicatlan Biosphere Reserve (TCBR); It has an annual average temperature of 21°C and 380 mm of precipitation. The TCBR is considered a site of high diversity and endemism. The predominant vegetation corresponds to xerophilous scrub, with a large extent of columnar cactus forest. Extrafloral nectaries are glands that can be located on any vegetative part of the plant (stem, petiole, stipules, leaves, bracts), that produces nectar and attracts a great diversity of insects but are not associated with the pollination process. The objective of this guide is to show the diversity of extrafloral nectaries associated with 17 plant species.
