Legend:  planted species.

[fieldguides.fieldmuseum.org] [548] version 3 8/2020

Wind-swept barrens are found on the top of ridges and stony terraces. The plants with tufted growth form and creamy-white flowers are the Mountain Awns (*Dryas octopetala*). During the winter, this habitat is usually without snow-cover. CE-m. 83-041-03.

Fen and marsh vegetation are found in the lowland. The dominant plant is the Arctic Cotton-grass (*Eriophorum scheuchzeri*) having ripe fruits with long woolly hairs. This is the vegetation type with the highest biomass production and of extreme importance to foraging Geese and Muskoxen. CE-m. 83-055-02.

Mixed steppe and dwarf shrub heath partly shaped by large herbivores (Musk-oxen and Caribou) through their impact on vegetation species composition, soil structure, and ecological dynamics. Patches of salt crusts are seen, which favor plant species adapted to this environment. CW-m. 83-026-01.

Although they affect an infinitesimal area in Greenland, warm springs create a unique local environment for several plant species including mosses, ferns, *Salix* and several herbs. Many warm springs should be considered as future red-listed habitats. CE-m. 83-063-08.

Sune Holt and Jan Thomas Johansson

Produced by S. Holt, J. Philipp, R. Foster, T. Wachter, with support from Connie Keller, Ellen Hyndman Fund and Andrew Mellon Foundation.

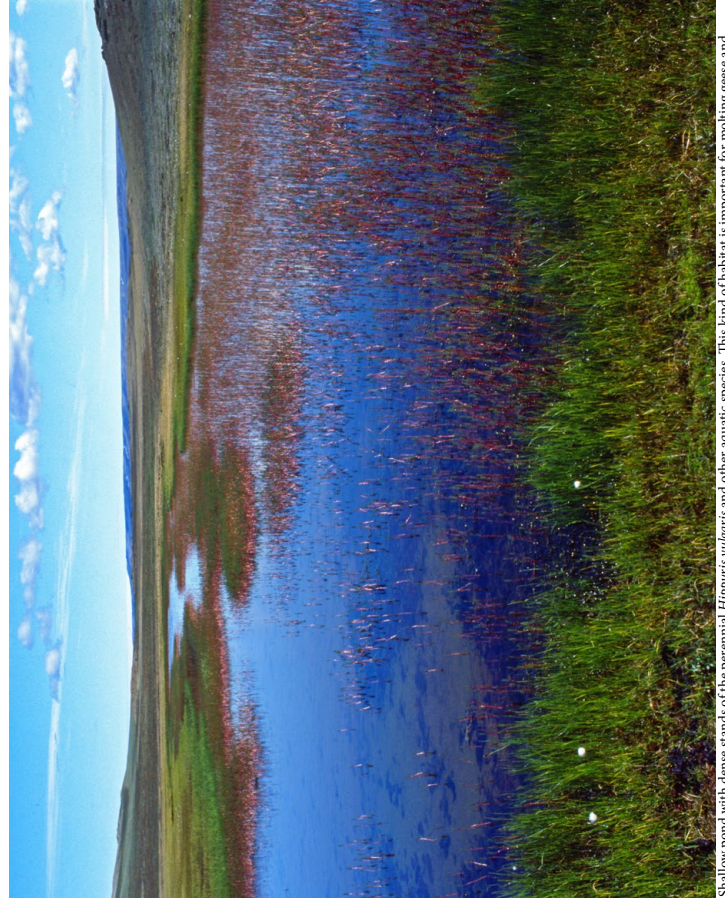

© Sune Holt [sneholt@outlook.com] and Jan Thomas Johansson [janthomas.johansson@bahnhof.se]. Photos by S. Holt and J.T. Johansson, except where indicated. Legend:  planted species.

[fieldguides.fieldmuseum.org] [548] version 3 8/2020

Some of the most developed willow copses are found along water courses. Here the stands of *Salix glauca* have grown to a height of 2-3 meters and are frequently used by muskoxen to scratch away old layers of wool. CW-m. 83-027-11.

Shallow pond with dense stands of the perennial *Hippuris vulgaris* and other aquatic species. This kind of habitat is important for molting geese and waterfowls for avoiding predators as e.g. the Arctic Fox. CE-m. 83-055-02.

Vegetated sand dunes are found on many places but are most frequent in the Southern and central part of the island around the coastlines, where intense winds migrate the sand landward. The vegetation here is always unique due to the special environment important for trapping the sand. CE-m. 83-034-06.

The thermal spring at Norre Fjord, Liverpool Land has only very small patches of thermally-influenced wetlands associated with it. A few rare species in the Greenland flora are found here. Mineral deposits are clearly visible on the rocks above the waterline CE-m. 85-042-47.

# Plants of GREENLAND

Sune Holt and Jan Thomas Johansson

Produced by S. Holt, J. Philipp, R. Foster, T. Wachter, with support from Connie Keller, Ellen Hyndman Fund and Andrew Mellon Foundation.

Legend:  planted species.

[fieldguides.fieldmuseum.org] [548] version 3 8/2020

An example on how topography, soil moisture and exposure to sun and wind create very sharp boundaries between vegetation types. In the foreground is a wind-swept barren, and below the accumulated snow, an herb-covered meadow on the South-facing slope. CE-m. 85-034-12.

The thickness of the snow-deposits is key to the vegetation downstream in an environment where the growth period is only a few months, or less, every year. Closest to the long-persisting snow, only a very few adapted species will grow due to the extremely short growth period here. CE-m. 82-039-04.

Most of Greenland is covered by snow and ice. The different vegetation types are populated by plant species highly adapted to snow cover, length of the snow-free period, moisture during the growth season, wind speed, and temperature from insolation. Photo taken 27 April. CE-m. 85-006-51.

A little brook carrying meltwater away from the accumulated snow in the back ground. The high soil moisture on the shores creates an excellent environment for highly diverse herbaceous vegetation and important foraging habitat for grazing animals. CE-m. 83-047-08.

Map of Greenland with indication of floristic provinces and districts shown as pink solid lines and pink stippled lines, respectively according to Böcher et al. (1978): Greenland Flora (in Danish). The map shows the altitude of the land area including the Ice Cap. Source: the author based on GTOPO30 1x1 km digital elevation model (DEM) using the UTM zone 24 N (EPSG:32624) projection and curve interval of 200 meters. This Field Guide is based on 6 years of field work covering the floristic provinces: CW, SW, S, CE, and NE.
